## Types of risks to consider in R&D partnerships

## **Balance of sponsorship**

Baringa

If your organisation is the non-sponsoring party, what is the right level of oversight and involvement in the research being conducted?

What is the recommended split of responsibilities (e.g. safety database ownership) within the partnership, based on the role of each partner and sponsorship?

## Nature of the research

What type of research is being conducted (e.g. discovery vs. clinical development, interventional vs. non-interventional) and what are the related and specific considerations when partnering?

What type of partner are you collaborating with? Are there multiple parties involved? Is this the first time your organisation is working with them?

## Intent of partnership

Is your organisation planning to submit or maintain a Marketing Authorisation based on the research being conducted, and how does this impact data sharing between partners?

Is your organisation planning to use the data or insights from the research to inform key internal decisions or strategies?
